Question: 1

Which of the following best describes the primary role of HPE Morpheus Enterprise Software in IT operations?

- A. It provides a hardware replacement platform for datacenters
- B. It acts as a unified hybrid cloud management and automation platform
- C. It serves as a dedicated backup and recovery solution
- D. It replaces hypervisors with container-native workloads

Answer: B

Explanation:

HPE Morpheus Enterprise Software is designed as a unified hybrid cloud management and automation platform. It helps IT teams bridge the gap between multiple environments, including private, public, and hybrid clouds. Unlike point solutions, Morpheus centralizes provisioning, governance, and automation. Its focus is not on hardware replacement or backup solutions but simplifying complex IT environments.

Question: 2

Which two challenges does HPE Morpheus help organizations address?

- A. Shadow IT and lack of governance
- B. Hardware lifecycle automation
- C. Complexity of multi-cloud provisioning
- D. Vendor lock-in for data storage

Answer: A, C

Explanation:

HPE Morpheus tackles shadow IT by offering IT-approved self-service portals with policy-based governance. It also simplifies multi-cloud provisioning, giving consistent workflows across AWS, Azure, GCP, and on-premises environments. While it improves flexibility and reduces lock-in risks, its core role is not hardware lifecycle automation or storage vendor neutrality.

Question: 3

How does HPE Morpheus improve developer productivity in enterprises?

- A. By providing an integrated CI/CD pipeline with role-based access
- B. By eliminating all security controls for faster deployments
- C. By centralizing logging for developers across all environments
- D. By offering self-service provisioning of infrastructure and services

Answer: D

Explanation:

Morpheus enhances developer agility by enabling self-service provisioning of infrastructure and services. This reduces wait times traditionally associated with IT tickets. Instead of bypassing security, Morpheus enforces policies and governance. It also integrates with CI/CD but not as a replacement pipeline; its main contribution is automation and self-service.

Question: 4

Which two features make HPE Morpheus valuable in reducing IT operational costs?

- A. Automated provisioning and de-provisioning
- B. Centralized policy enforcement
- C. Elimination of all third-party security tools
- D. Real-time multi-cloud cost visibility

Answer: A, D

Explanation:

Morpheus reduces cost by automating provisioning/de-provisioning, which prevents resource sprawl, and by providing real-time visibility into multi-cloud costs. IT teams can track usage and optimize spend. While centralized policy enforcement is beneficial for governance, direct cost reduction comes from automation and visibility. Eliminating security tools is neither possible nor recommended.

Question: 5

Which of the following best describes how HPE Morpheus addresses the issue of shadow IT?

- A. By preventing employees from accessing public cloud accounts
- B. By enforcing strict manual approval workflows
- C. By providing governed self-service provisioning portals
- D. By integrating only with private data centers

Answer: C

Explanation:

Shadow IT arises when developers bypass IT policies to gain cloud resources directly. Morpheus addresses this by providing governed self-service portals, ensuring teams can get what they need without violating compliance. Unlike blocking cloud use, Morpheus balances agility with governance.
