Question: 1

A system administrator supporting a financial-services organization is reviewing production integration, transportation integration, RF, MFS, and monitoring in SAP Extended Warehouse Management. Users report that messages are failing or arriving with incomplete business data. The change is needed without disrupting active users. Complete the corrective configuration and validation so that the team can support the process after go-live.

A. See the Explanation.

Answer: A

Explanation:

The configuration is complete only when four checks pass: requirement check—confirm source and target connectivity, credentials, certificates, and trust; design check—validate endpoint, destination, communication arrangement, and integration configuration; execution check—review mappings, mandatory fields, value conversions, and message payloads; operational check—use monitoring logs to correct the root cause, reprocess safely, and reconcile the target records. Capture evidence for each check, review exceptions with the business owner, and release the change only after the end-to-end result is reconciled.

Question: 2

A healthcare provider is implementing SAP Extended Warehouse Management. The system administrator reports that authorized users cannot perform the task while other users have excessive access in the area of Fiori roles and user experience. The customer expects measurable improvement after activation. Troubleshoot the solution with limited downtime so that the team can support the process after go-live.

A. See the Explanation.

Answer: A

Explanation:

Address Fiori roles and user experience by first confirming the approved business requirement and the responsible configuration. Then map the job responsibility to the least-privilege role or permission group, correct target populations, constraints, role collections, or organizational restrictions, and test with representative users and verify sensitive-field access. Finish by completing the final validation action: document the control, approval owner, and periodic access review. This approach corrects the immediate issue while preserving traceability, supportability, and the intended business control.

Question: 3

A implementation lead supporting a regional retail group is reviewing data migration and reconciliation in SAP Extended Warehouse Management. Users report that loaded records contain duplicates, missing relationships, or invalid values. The change is needed after a recent quarterly release. Complete the corrective configuration and validation so that the solution is ready for production.

A. See the Explanation.

Answer: A

Explanation:

Use this sequence: 1) Profile and cleanse source data against target rules before loading; 2) load prerequisite and parent objects before dependent transactions; 3) run validation reports, reconcile totals, and correct rejected records; 4) repeat the mock cutover and obtain business-owner sign-off. Record the test evidence and obtain process-owner approval before moving the change to production.
