Question: 1

A vSAN cluster shows increased latency on multiple disk groups. Which VCF tool should be used first to monitor performance?

- A. vSphere Lifecycle Manager
- B. VCF Operations Performance Charts
- C. NSX Manager
- D. SDDC Manager Certificates

Answer: B

Explanation:

VCF Operations provides real-time and historical performance metrics for vSAN clusters. It helps identify latency, congestion, and IOPS bottlenecks. This is the primary monitoring tool in VCF environments.

Question: 2

A storage array connected via FC shows path failures. What should be checked first?

- A. vSAN Health Service
- B. Multipathing configuration on ESXi
- C. Supervisor Cluster status
- D. VCF Identity Broker

Answer: B

Explanation:

For non-vSAN storage, multipathing ensures redundancy and load balancing. Path failures often indicate misconfiguration or SAN connectivity issues. Checking NMP/PSP settings is essential.

Question: 3

A vSAN object is inaccessible after a host failure. What is the likely reason?

- A. Storage policy not compliant
- B. ECMP misconfiguration
- C. vMotion failure
- D. Content library sync issue

Answer: A

Explanation:

If the storage policy requires higher failures to tolerate (FTT) than available hosts, objects become inaccessible. Compliance must match cluster redundancy. Host failures can reduce availability below policy requirements.

Question: 4

Which tool helps identify failed components inside a vSAN disk group?

- A. vSAN Skyline Health
- B. NSX Traceflow
- C. VCF Automation Console
- D. Cloud Proxy UI

Answer: A

Explanation:

vSAN Skyline Health provides component-level diagnostics. It detects disk failures, capacity issues, and network misconfigurations. It is the primary troubleshooting interface for vSAN.

Question: 5

A workload domain vCenter becomes unreachable. What should be verified first?

- A. NSX Edge cluster
- B. vCenter appliance services
- C. Supervisor namespaces
- D. Content Library policies

Answer: B

Explanation:

If vCenter is unreachable, verify that required services such as vpxd and PSC services are running. Service failure is a common cause. Appliance management interface can confirm status.
